

ARCHITECTURAL DETAIL

TWO-STOREY DETAIL

Elevations utilise a 2-storey expression which coordinates with steps in height of the buildings themselves.

EXTERNAL LIFT CORES

Lift shafts are steel framed and glazed forming highly transparent enclosures which provide interruption to the form of the building and promote views north/south.

SERRATED EDGE FACADE

Each serration orients views to the north or south, and pairs provide 'captured' balcony areas along the entire long edges of the building perimeter. In a similar way, sunlight is either encouraged or screened from the interiors of each serration.

PROWS DETAIL

In contrast, the prows of each block create promontories which define site edges, forming generous cantilevers which provide covered areas for outdoor seating, meeting places and landscape.
